# Estimating mismatch

## Two basic ways

- 1 Estimate changes in matching efficiency  
Barnichon and Figura (2010)  
What drives movements in the unemployment rate?  
A decomposition of the Beveridge curve
- 2 Estimate dispersion in vacancies and unemployment  
Sahin, Song, Topa and Violante (2011)  
Measuring Mismatch in the US labor market

- Shifts in the Beveridge curve
  - sometimes seen as indicating movements in the level of “equilibrium” or “structural” unemployment
  - difficult to interpret
- Factors that shift the Beveridge curve
  - Changes in intensity of layoffs and quits
  - Changes in labor force participation
  - Changes in the efficiency of matching workers to jobs (mismatch)
- Decompose unemployment movements 1976-2009
  - Firm-induced (labor demand)
    - Movements along the curve
    - Changes in intensity of layoffs
  - Worker-induced (labor supply)
    - Changes in intensity of quits
    - Changes in labor force participation
    - Demographics
  - Changes in the efficiency of matching workers to jobs

# Barnichon and Figura (2010): method

- Steady state unemployment

$$u_t^{ss} = \frac{s_t}{s_t + f_t}$$

- Separation and finding rates

$$s_t = \lambda_t^{EU} + \frac{\lambda_t^{EI} \lambda_t^{IU}}{\lambda_t^{II}}$$

$$f_t = \lambda_t^{UE} + \frac{\lambda_t^{UI} \lambda_t^{IE}}{\lambda_t^{II}}$$

- Matching function

$$\lambda_t^{UE} = m_{0t} \theta_t^{1-\sigma}$$

- Log-linearizing

$$d \ln u_t^{ss} = d \ln u_t^{bc} + d \ln u_t^{shifts} + d \ln u_t^{eff}$$

$$d \ln u_t^{bc} = -\alpha^{UE} (1 - \sigma) d \ln \theta_t$$

$$d \ln u_t^{shifts} = \alpha^{EU} d \ln \lambda_t^{EU} + \alpha^{EI} d \ln \lambda_t^{EI} + \alpha^{IU} d \ln \lambda_t^{IU} - \alpha^{IE} d \ln \lambda_t^{IE} - \alpha^{UI} d \ln \lambda_t^{UI}$$

$$d \ln u_t^{eff} = -\alpha^{UE} d \ln m_{0t}$$

Figure 1: The US Beveridge curve, 1979Q1-2010Q3.

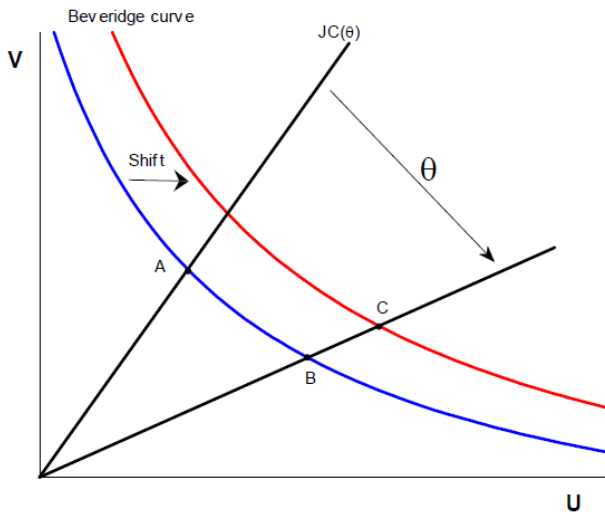

Figure 2: The Beveridge curve: shifts and movement along the curve.

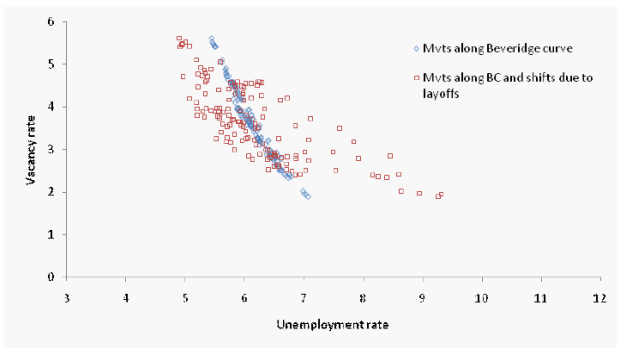

Figure 13: Counterfactual Beveridge curves, 1976-2009. Blue circles: counterfactual Beveridge curve using the unemployment rate implied by movements in labor market tightness. Red squares: counterfactual Beveridge curve using the unemployment rate implied by movements in labor market tightness and shifts due to layoffs.

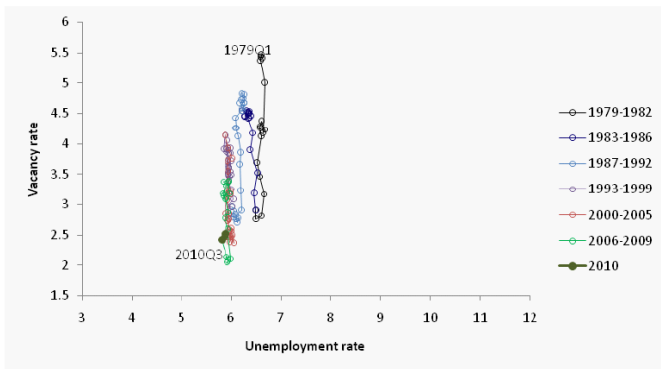

Figure 14: Counterfactual Beveridge curve using the unemployment rate generated by changes in demographics.

Figure 15: Counterfactual Beveridge curve using the unemployment rate generated by movements in and out of the labor force.

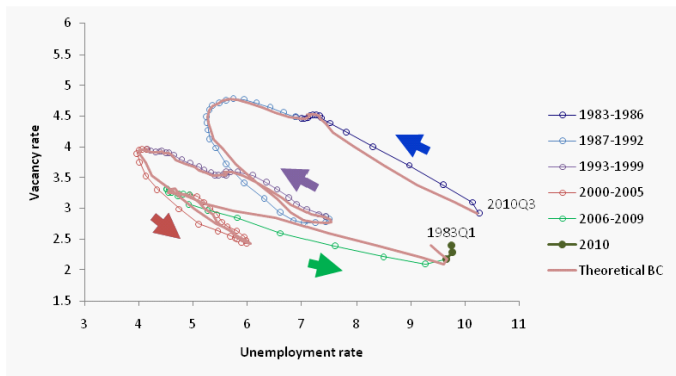

Figure 16: Empirical and theoretical Beveridge curve (thick plain red). For clarity of exposition, the curves plot the 4-quarter moving averages of unemployment and vacancies, and the data start in 1983Q1, the beginning of the labor market recovery in the early 80s recession.

- Decompose unemployment movements 1976-2009
  - Firm-induced (labor demand)
    - Movements along the curve
    - Changes in intensity of layoffs
  - Worker-induced (labor supply)
    - Changes in intensity of quits
    - Changes in labor force participation
    - Demographics
  - Changes in the efficiency of matching workers to jobs
- Data on worker transitions from CPS
- Conclusions about mismatch
  - Changes in matching efficiency play on average a smaller role than changes in labor demand or supply
  - Matching efficiency can decline substantially in recessions
  - In GR, lower matching efficiency added about 1.5%-point to the unemployment rate

- Economy consists of large number of distinct labor markets
  - Frictional unemployment in each labor market
  - Distribution of vacancies over labor markets exogenously given
  - Can unemployed workers be reallocated in a way that reduces aggregate unemployment?
- Mismatch indices
  - $\mathcal{M}^u$  = fraction of unemployed in the 'wrong' labor market
  - $\mathcal{M}^h$  = fraction of hires lost because of misallocation
  - Can use  $\mathcal{M}^h$  to calculate counterfactual unemployment rate
- Data
  - Unemployment from CPS
  - Vacancies from JOLTS, 2000-2010

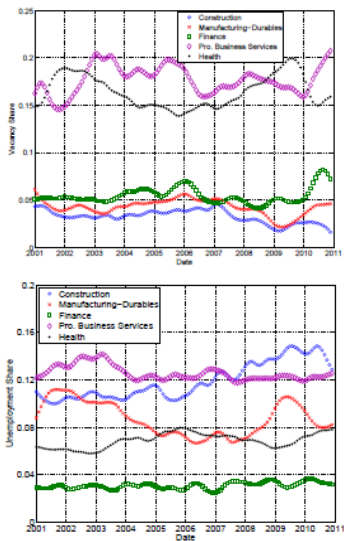

Figure 2: Vacancy and Unemployment Share by Sector

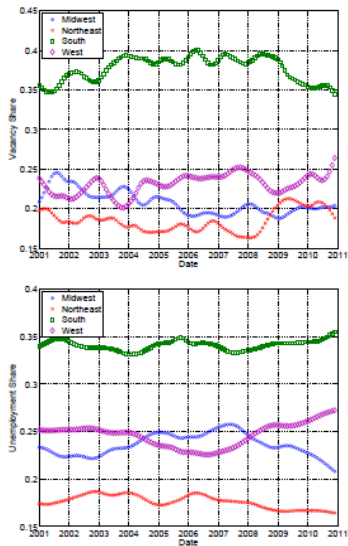

Figure 3: Vacancy and Unemployment Share by Census Region

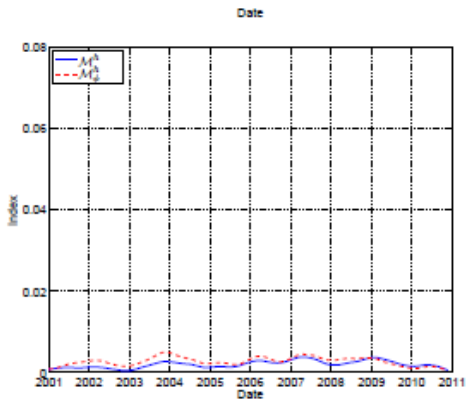

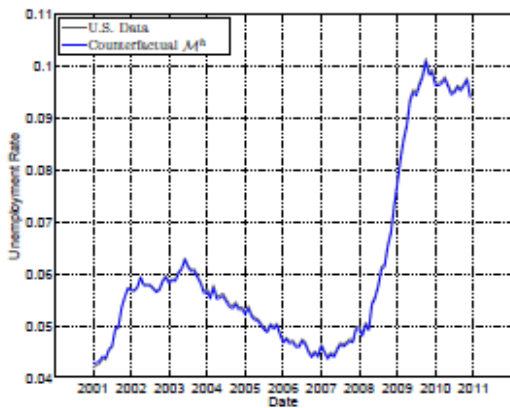

Figure 9: Mismatch Index  $M_t^u$  (left panel) and  $M_t^h$  (right panel) by Census Region

- Mismatch at the sectoral level
  - Increased during GR
  - Started to come down in 2010  $\Rightarrow$  cyclical?
  - Accounts for at most 0.7%-point of unemployment
- Geographic mismatch
  - Little role
  - Consistent with earlier studies on house-lock mechanism
- Previous literature
  - Lilien (1982), Abraham and Katz (1984)
  - Barnichon and Figura (2011)  
What Drives Matching Efficiency? A Tale of Composition and Dispersion  
Relate dispersion in labor market tightness to matching efficiency
